Session Title: FIT Clinical Decision Making: Non-Invasive Imaging and Valvular Heart Disease
Abstract Category: Non Invasive Imaging
Presentation Number: 1150-128

Authors: Nazmat Shamma, Roohi Mahany, Oh Chen, Paul M. Stashin, Joanna Chikwa, Smadar Kort, Stony Brook University, Stony Brook, NY, USA

Background: Atrial Septal Defect (ASD) closure device related infective endocarditis a year after implantation in a pregnant woman.
Case: 29 year old 20 week pregnant female w/ ASD closure a year ago for primary stroke prevention, presented with fever, and myalgias. She underwent dental cleanings while on prophylactic antibiotics (first 6 months) and other. Exam and labs showed Jarvisway lesions and sepsis. CT chest showed patchy bilateral infiltrates concerning for septic emboli. Blood Cultures showed Methicillin Sensitive Staph Aureus.

Decision-making: Transthoracic Echocardiogram showed a well seated closure device along the interatrial septum. Although no vegetations were visualized a decision was made to proceed with transesophageal echocardiogram using no sedation, revealing a large mobile vegetation attached to the left atrial surface of the device (image A-C). Despite relatively high risk of pregnancy loss during surgery (30-40%) the risk of sepsis and embolic complications to both patient and fetus were higher. The device was surgically excised (image D) and the ASD patched successfully.

Conclusion: RESPECT, CLOSE, and REDUCE trials showed superiority of ASD closure versus medical for cryptogenic strokes. Most benefit was in those with large ASD, atrial septal aneurysms, and previous unprovoked thromboembolic events. This case highlights importance of appropriate patient selection for ASD closure, prophylactic antibiotics, challenges in diagnosis and management during pregnancy.

Atrial septal defect in infants symptoms. Is atrial septal defect dangerous. Can atrial septal defect be detected during pregnancy. What is atrial septal defect in newborn baby. Atrial septal defect in pregnancy icd 10. Management of atrial septal defect in pregnancy.

The long-term outlook is excellent, and usually no medicines and no additional surgery or catheterization are needed. After surgery or catheter closure, your child's pediatric cardiologist may advise some activity changes for a short time. The cause is usually unknown. Depending on the type of ASD, your child's pediatric cardiologist may examine your child periodically to look for uncommon problems. However, with progressive damage to the lung vessels, the pressures in the lung may rise, and the patient can become more severely limited, eventually developing Eisenmenger's syndrome, described below. Sometimes, if the ASD is an unusual position within the heart, or if there are other heart defects such as abnormal connections of the veins bringing blood from the lungs back to the heart (pulmonary veins), the ASD can't be closed with the catheter technique. If the hole is small, it may have minimal effect on heart function. Some children can have other heart defects along with ASD. The risk from a pregnancy goes up if there's an unrepaired ASD but pregnancy is usually safe unless there is pulmonary hypertension. If the opening is small, it won't cause symptoms because the additional work done by the heart and lungs is minimal. After recent surgery or catheter closure, your cardiologist may advise some limits on your physical activity for a short time, even when there is no pulmonary hypertension. On physical examination, the only abnormal finding may be a murmur (noise heard with a stethoscope) and other abnormal heart sounds. Then surgery is needed. There isn't any medicine that will make the ASD get smaller or close any faster than it might do naturally. If the opening is large, the only abnormal finding may be a murmur (noise heard with a stethoscope) and other abnormal heart sounds. If the opening is small, it won't cause symptoms because the heart and lungs don't have to work harder. The increased blood in the may increase a patient's susceptibility to pneumonia and bronchitis. Normally, the left side of the heart only pumps blood to the body, and the right side of the heart only pumps blood to the lungs. Patients who have had a transient ischemic attack (TIA) or a stroke and are found to have a PFO may be treated with aspirin or another "blood thinner. Many defects can be sewn closed without using a patch. More information for parents of children with ASD What causes it? Should it be repaired in adulthood? Activity Restrictions Most patients with small, unrepaired atrial septal defects and repaired ASDs do not need any special precautions and may be able to participate in normal activities without increased risk. Surgery and other treatments may not be needed. Some patients with ASD have no symptoms. What if the defect is still present? Genetic factors can sometimes play a role. This extra amount of blood flow in the lung arteries can also cause gradual damage. Once an ASD has been closed, it's unlikely that more surgery will be needed. ASD is a defect in the septum between the heart's two upper chambers. How does it affect the heart? Every child is born with an opening between the upper heart chambers. A large ASD is usually closed in early childhood, even in patients with few symptoms, to prevent complications later. Those who have palpitations or who faint need to be evaluated by their cardiologist and may need medical therapy. Will You Need More Surgery? Small ASDs that are discovered in infants often close or narrow on their own. The septum is a wall that separates the heart's left and right sides. Problems You May Have People with small unrepaired or repaired atrial septal defects rarely have any late problems. If the hole is small, it may not cause symptoms or problems. Your cardiologist can monitor you with noninvasive tests if needed. However, if the ASD is in an unusual position within the heart, or if there is a hole between the right and left sides of the heart, the ASD may cause symptoms. What if the defect is still present? tenamrep esuac yam siht ,sraey ynam yllausu ,emit revO .erulial traeh ot gnidael ,detceffa neeb evah yam pmup ot ytiliba s'traeh eht ,efil ni etal desongaid si DSA eht fi ,osIA .smelborp nommocnu rof kool ot tsigoloidrac a yb yllacidoirep nees eb dluohs DSA fo yrotsih a htiw stneitaP .ltrib erofeb sgnul eht morf yawa ruoted ot doolb swolla taht gninepo latef lamron a s'tl .erusserp doolb lortnoc ot sgurd dna retteb pmup traeh eht pleh ot sgurd ,sciteruid eriuerg nac noitidnoc siht .htrib retfa esolc t'nseod dna lamron naht regral si gninepo eht semitemoS .ksir desaerctni tuohitv seitivitca lamron ni etapictrap ot elba eb yam dna snoituacerp laiceps yna deen ton yam dlihc ruoY .edis thgir eht ot kcab edis tfeI s 'traeh eht morf skael doolb)derf hciR-negyxo fo tnuoma egral a ,airta eht neewteb stsice tcefed egral a nehW .smotpmys on evah netfo DSA na htiw nerdlihC .negyxo htiw dehserfer neeb gnivah ydaerla etipsed ,sgnul eht ot kcab depmup si doolb siht nehT .norcaD sa hcus lairetam citehtnys ro)traeh eht edistuo gniinil lamron eht(muidracirep fo hctap a htiw desolc erew steefed emoS ?tcepxe I nac tahw ,doohdihlc ni DSA na esolc ot ynegrus dah I H .degamad yllaudarg emoceb nac seiretra gnul eht dna redrah krow sgnul dna traeh eht sekam seiretra gnul eht otni depmup gnieb doolb artxe eht ,egral si DSA eht fi ?erutuf eht ni deen I liiw tahw eraC gnioqno .dlihc eht enimaxe yllaugert isum tsigoloidrac cirtaldep a .DSA na esolc ot ynegrus retfa emit TROHS A ROF .EUQNHOCET RETHTAC EHT HTIW DESOLC EB TONNAC DSA EHT) SNIIEV YRANOMLUP (TRAEH EHT OT KCAB SGNUL EHT FO SNOITCENNOC LAMRONBA SA HCUS STCFEED TRAEH REHTO Yllausu ERA DNINTCARDISER OTHTGRUND LAFHA LOF ROFTH HAS HUFHAIN HUFTH HAS HIA? No RATIB Medical Medical Follow-up Sometimes medicines to prevent blood clots and infection are used for a few months after ASD closure. But after successful healing from surgery or catheter closure, no restrictions are usually needed. In most children the cause isn't known. Most large atrial septal defects now can be closed either with open-heart surgery or during a cardiac catheterization using a device inserted into the opening to plug it (referred to as interventional or therapeutic catheterization (PDF)). How does the ASD affect me? If the ASD is large, it can be closed with open-heart surgery, or by cardiac catheterization using a device inserted into the opening to plug it. Endocarditis Prevention This isn't needed beyond six months after repair either by surgery or device. See the section on EndocarditisA for more information. For a short time after surgery to close an ASD, a cardiologist must regularly examine you. Most children with an ASD are not at increased risk for developing endocarditis. If the opening is small, surgery or other treatments may not be needed. However, many defects that required surgery may have been sewn closed without using a patch. There is a slight risk of stroke during pregnancy, so precautions against blood clots may be recommended. What will my child need in the future? In a child with ASD, blood can travel across the hole from the left upper heart chamber (left atrium) to the right upper chamber (right atrium) and out into the lung arteries. A large unrepaired ASD may sometimes lead to heart failure during pregnancy but this is usually well controlled with medication if caught early. These include electrocardiograms, Holter monitors, exercise stress tests and echocardiograms. If the opening is small, it doesn't make the heart and lungs work harder. What about preventing endocarditis? If pulmonary hypertension develops (which is uncommon), some people may need extra medications. How does the ASD my child? Many healthy adults still have a small leftover opening in the wall between the atria, sometimes called a Patent Foramen OvaleA (PFO). It is important to emphasize that the vast majority of people with small PFOs and ASD's don't have strokes and don't need to have their defects closed. closed.

A ventricular septal defect is an opening in the ventricular septum, or dividing wall between the two lower chambers of the heart known as the right and left ventricles. VSD is a congenital (present at birth) heart defect. As the fetus is growing, something occurs to affect heart development during the first eight weeks of pregnancy, resulting ... 23.09.2021 · What Happens in a Ventricular Septal Defect? The right ventricle and left ventricle of the heart are separated by shared wall, called the ventricular septum Kids with a VSD have an opening in this wall. As a result, when the heart beats, some of the blood in the left ventricle (which has been enriched by oxygen from the lungs) flows through the hole in the septum into ... 23.03.2022 · The American Heart Association explains the congenital heart defect complete atrioventricular, AV, canal, complete AV canal, complete common AV canal, and endocardial cushion defect in children and adults. Essentially, they all describe a similar heart problem.
